1. Introduction to the RCSB Protein Data Bank (PDB)

Downloaded composition stats from: https://www.rcsb.org/stats/summary

For context: Release 2023_04, 13-Sept-2023 of UniProtKB?TrEMBL contians 251,600,768 sequence entries. The PDB only contains 183,201.

The numbers are read as characters because there are commas, so we have to remove the commas.

```
x <- stats$X.ray
x
```

```
[1] "158,844" "9,260"   "8,307"   "2,730"   "164"     "11"

```

```
[1] 158844   9260   8307   2730    164     11
```

Write a function based on this so it can be replicated for all columns easily

```r
rm.comma <- function(x){
  as.numeric(gsub(",", "", x))
}
```

```r
rm.comma(stats$EM)
```

```
[1] 11759  2054  3667   113     9     0
```

I can use `apply` to fix the whole table

```r
pdbstats <- apply(stats, 2, rm.comma)
rownames(pdbstats) <- rownames(stats)
head(pdbstats)
```

```

84.83% of structures in PDB are solved by X-Ray, 8.33% are solved by Electron Microscopy.

Q2: What proportion of structures in the PDB are protein?

```
round(pdbstats[1, "Total"]/sum(pdbstats[,"Total"])*100, 2)
```

```
[1] 86.67
```

86.67% of structures in PDB are protein.

Q3: Type HIV in the PDB website search box on the home page and determine how many HIV-1 protease structures are in the current PDB?

> SKIPPED

Q4: Water molecules normally have 3 atoms. Why do we see just one atom per water molecule in this structure?

The hydrogen atoms are very small, so small that they are not visible in the structure.

Q5: There is a critical "conserved" water molecule in the binding site. Can you identify this water molecule? What residue number does this water molecule have

The water molecule is water 308.

Q6: Generate and save a figure clearly showing the two distinct chains of HIV-protease along with the ligand. You might also consider showing the catalytic residues ASP 25 in each chain and the critical water (we recommend "Ball & Stick" for these side-chains). Add this figure to your Quarto document.

Continued on 11/7 # 4. Comparative structure analysis of Adenylate Kinase Starting from only one Adk PDB identifier (PDB:1AKE), we will search the entire PDB for related structures using BLAST, fetch, align and superpose the identified structures, perform PCA and finally calculate the normal modes of each individual structure.

We need some packages: `bio3d` and `msa`. The `msa` package is from BioConductor. These packages focus on genomics type work and are managed by the `BioManager` package.

Install `install.packages("BiocManager")` and then `BiocManager::install("msa")` all entered into the R console.

Q10. Which package is found only on BioConductor and not CRAN?

msa

Q11. Which of the above packages is not found on BioConductor or CRAN?

bio3d-view

Q12. True or False? Functions from the devtools package can be used to install packages from GitHub and BitBucket?

True

Call:
  pdbaln(files = files, fit = TRUE, exefile = "msa")

Class:
  pdbs, fasta

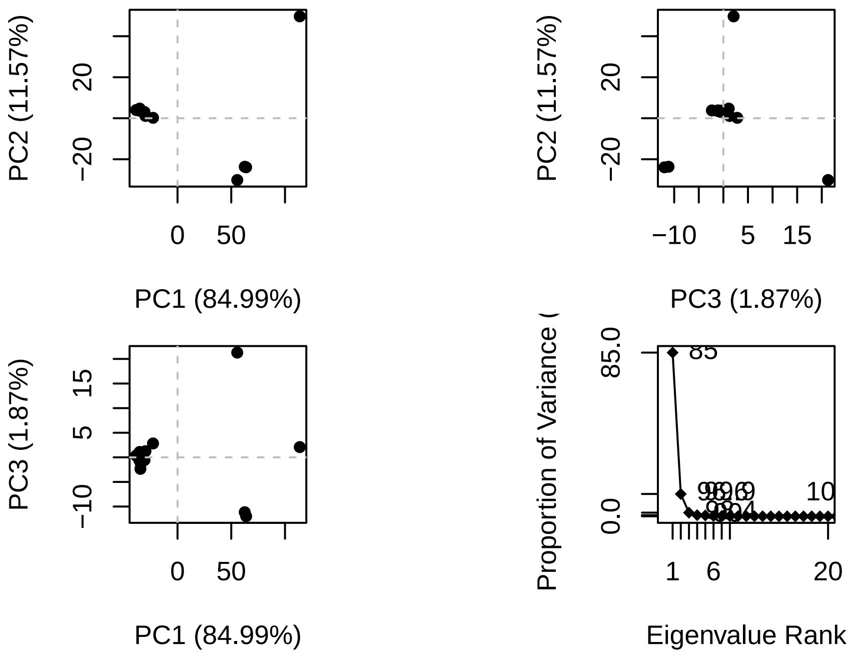
Alignment dimensions:
  13 sequence rows; 227 position columns (204 non-gap, 23 gap)

+ attr: xyz, resno, b, chain, id, ali, resid, sse, call
```

Principal Component Analysis

Perform PCA

```
pc.xray<- pca(pdbs)
plot(pc.xray)
```



Results of PCA on Adenylate kinase X-ray structures. Each dot represents one PDB structure.

Further visualization, visualizing the first PCA

```
pc1 <- mktrj(pc.xray, pc=1, file="pc_1.pdb")
```

Shows the major differences between all the structures.
