How many genes left?

```
nrow(countData)
```

[1] 15975

Running DESeq2

Warning in DESeqDataSet(se, design = design, ignoreRank): some variables in design formula are characters, converting to factors

```
dds = DESeq(dds)
```

estimating size factors

estimating dispersions

gene-wise dispersion estimates

mean-dispersion relationship

final dispersion estimates

fitting model and testing

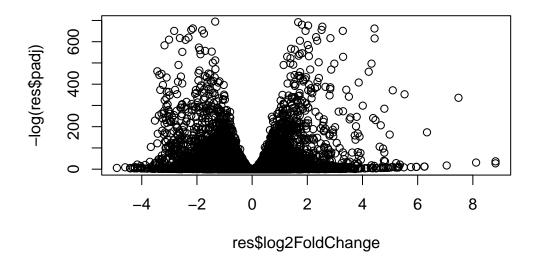

```
class: DESeqDataSet
dim: 15975 6
metadata(1): version
assays(4): counts mu H cooks
rownames(15975): ENSG00000279457 ENSG00000187634 ... ENSG00000276345
    ENSG00000271254
rowData names(22): baseMean baseVar ... deviance maxCooks
colnames(6): SRR493366 SRR493367 ... SRR493370 SRR493371
colData names(2): condition sizeFactor
res = results(dds, contrast=c("condition", "hoxa1_kd", "control_sirna"))
```

Q. Call the summary() function on your results to get a sense of how many genes are up or down-regulated at the default 0.1 p-value cutoff.

```
out of 15975 with nonzero total read count
adjusted p-value < 0.1
LFC > 0 (up) : 4349, 27%
LFC < 0 (down) : 4396, 28%
outliers [1] : 0, 0%
low counts [2] : 1237, 7.7%
(mean count < 0)
[1] see 'cooksCutoff' argument of ?results
[2] see 'independentFiltering' argument of ?results</pre>
```

Volcano plot

```
plot(res$log2FoldChange, -log(res$padj))
```

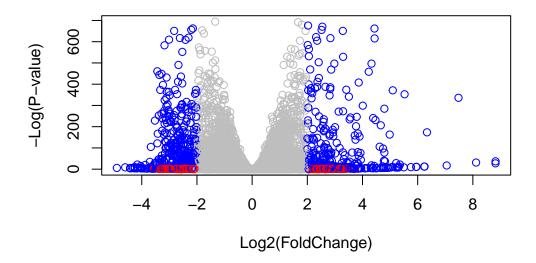

Q. Improve this plot by completing the below code, which adds color and axis labels

```
# Make a color vector for all genes
mycols <- rep("gray", nrow(res) )

# Color red the genes with absolute fold change above 2
mycols[ abs(res$log2FoldChange) > 2 ] <- "red"

# Color blue those with adjusted p-value less than 0.01
# and absolute fold change more than 2
inds <- (abs(res$padj)<0.1) & (abs(res$log2FoldChange) > 2 )
mycols[ inds ] <- "blue"

plot( res$log2FoldChange, -log(res$padj), col=mycols, xlab="Log2(FoldChange)", ylab="-Log(</pre>
```

Adding gene annotation

library("AnnotationDbi")

Q. Use the mapIDs() function multiple times to add SYMBOL, ENTREZID and GENENAME annotation to our results by completing the code below.

```
library("org.Hs.eg.db")
  columns(org.Hs.eg.db)
 [1] "ACCNUM"

Q. Finally for this section let's reorder these results by adjusted p-value and save them to a CSV file in your current project directory.

```
res = res[order(res$pvalue),]
write.csv(res, file="deseq_results.csv")
```

Section 2: Pathway Analysis

```
library(pathview)
```

Pathview is an open source software package distributed under GNU General Public License version 3 (GPLv3). Details of GPLv3 is available at http://www.gnu.org/licenses/gpl-3.0.html. Particullary, users are required to formally cite the original Pathview paper (not just mention it) in publications or products. For details, do citation("pathview") within R.

The pathview downloads and uses KEGG data. Non-academic uses may require a KEGG license agreement (details at http://www.kegg.jp/kegg/legal.html).

[161] "9583"
               "9615"
```

The main gage() function requires a named vector of fold changes:

```
foldchanges = res$log2FoldChange
names(foldchanges) = res$entrez
head(foldchanges)
```

```
1266 54855 1465 51232 2034 2317 -2.422719 3.201955 -2.313738 -2.059631 -1.888019 -1.649792
```

Run the gage pathway analysis

```
# Get the results
keggres = gage(foldchanges, gsets=kegg.sets.hs)
```

Look at the results:

```
attributes(keggres)
```

\$names

```
[1] "greater" "less" "stats"
```

```
# Look at the first few down (less) pathways
head(keggres$less)
```

```

```

Now we can use pathview() to make a pathway plot with the RNA-seq expression results showin in color.

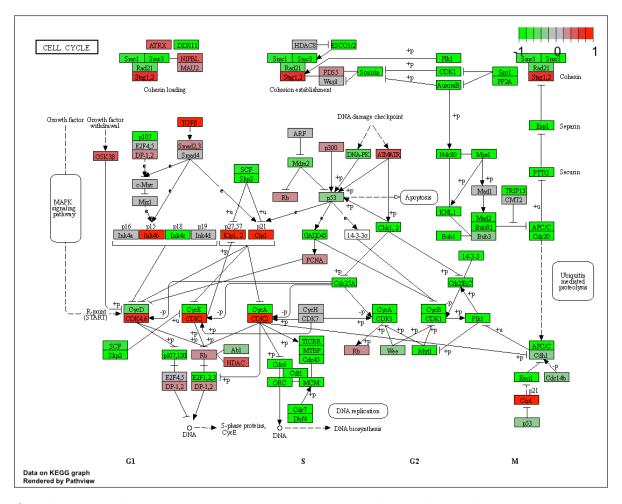

```
pathview(gene.data=foldchanges, pathway.id="hsa04110")
```

Info: Working in directory /Users/marin/Desktop/BIMM 143/Class 14

Info: Writing image file hsa04110.pathview.png

#

^{&#}x27;select()' returned 1:1 mapping between keys and columns

Can play with other input arguments in pathview() to change the display in various ways:

```
# A different PDF based output of the same data pathview(gene.data=foldchanges, pathway.id="hsa04110", kegg.native=FALSE)
```

'select()' returned 1:1 mapping between keys and columns

Warning: reconcile groups sharing member nodes!

```
[,1] [,2]
[1,] "9" "300"
[2,] "9" "306"
```

Info: Working in directory /Users/marin/Desktop/BIMM 143/Class 14

```
Info: Writing image file hsa04110.pathview.pdf
```

Can also pull out top 5 upregulated pathways

```
## Focus on top 5 upregulated pathways here for demo purposes only
keggrespathways <- rownames(keggres$greater)[1:5]

# Extract the 8 character long IDs part of each string
keggresids = substr(keggrespathways, start=1, stop=8)
keggresids</pre>
```

[1] "hsa04640" "hsa04630" "hsa00140" "hsa04142" "hsa04330"

Pass those IDs in keggresids to the pathview function to draw plots for all the top 5 pathways

```
pathview(gene.data=foldchanges, pathway.id=keggresids, species="hsa")

'select()' returned 1:1 mapping between keys and columns

Info: Working in directory /Users/marin/Desktop/BIMM 143/Class 14

Info: Writing image file hsa04640.pathview.png

'select()' returned 1:1 mapping between keys and columns

Info: Working in directory /Users/marin/Desktop/BIMM 143/Class 14

Info: Writing image file hsa04630.pathview.png

'select()' returned 1:1 mapping between keys and columns

Info: Working in directory /Users/marin/Desktop/BIMM 143/Class 14

Info: Writing image file hsa00140.pathview.png

'select()' returned 1:1 mapping between keys and columns
```

Info: Working in directory /Users/marin/Desktop/BIMM 143/Class 14

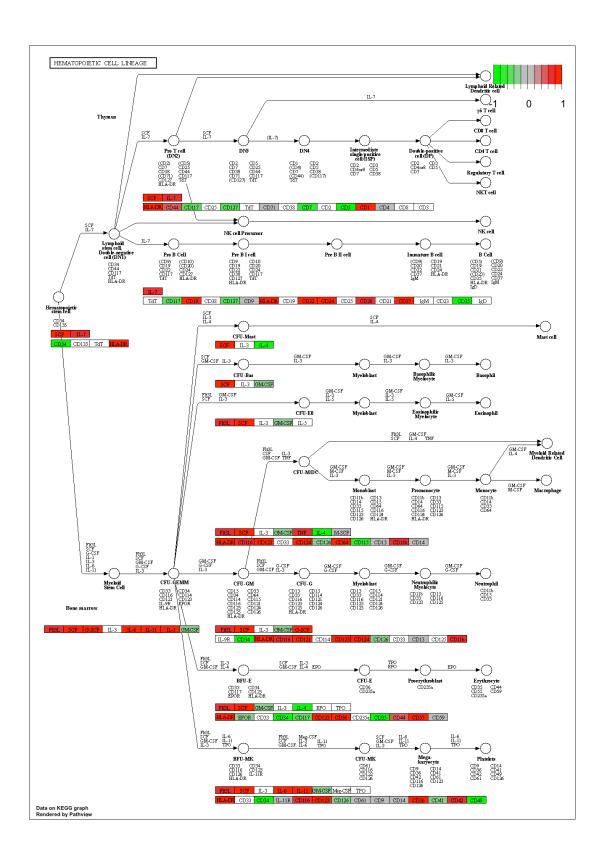

Info: Writing image file hsa04142.pathview.png

Info: some node width is different from others, and hence adjusted!

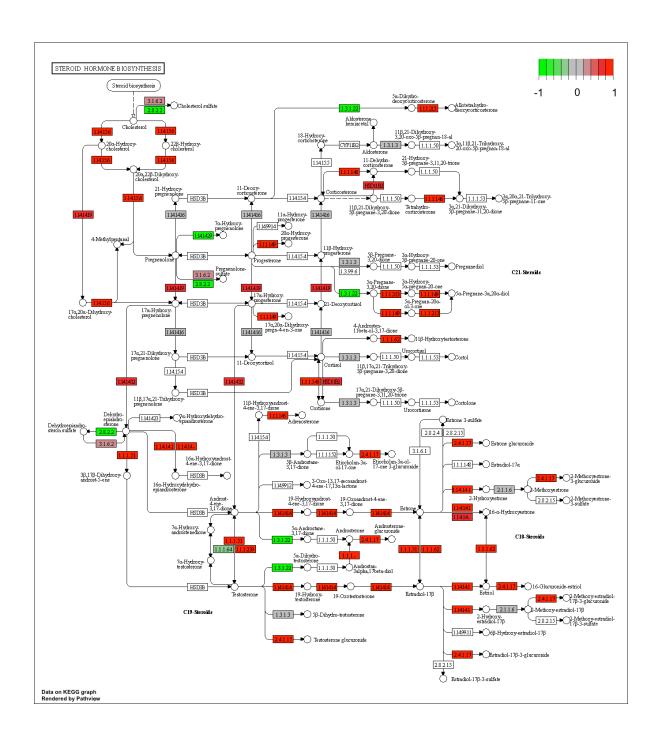

'select()' returned 1:1 mapping between keys and columns

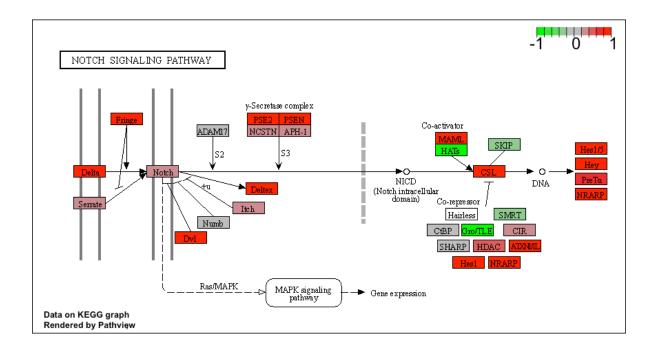

Info: Working in directory /Users/marin/Desktop/BIMM 143/Class 14

Info: Writing image file hsa04330.pathview.png

Q. Can you do the same procedure as above to plot the pathview figures for the top 5 down-reguled pathways?

```
## Focus on top 5 downregulated pathways
keggrespathwaysdown <- rownames(keggres$less)[1:5]

# Extract the 8 character long IDs part of each string
keggresidsdown = substr(keggrespathwaysdown, start=1, stop=8)
keggresidsdown

[1] "hsa04110" "hsa03030" "hsa03013" "hsa03440" "hsa04114"

pathview(gene.data=foldchanges, pathway.id=keggresidsdown, species="hsa")

'select()' returned 1:1 mapping between keys and columns

Info: Working in directory /Users/marin/Desktop/BIMM 143/Class 14

Info: Writing image file hsa04110.pathview.png</pre>
```

'select()' returned 1:1 mapping between keys and columns

Info: Working in directory /Users/marin/Desktop/BIMM 143/Class 14

Info: Writing image file hsa03030.pathview.png

'select()' returned 1:1 mapping between keys and columns

Section 4. Reactome Analysis

Reactome is a database consisting of biological molecules and their relation to pathways and processes. We can conduct over-representation enrichment analysis and pathway-topology analysis Reactome using the previous list of significant genes generated from the differential expression results above. First output the list of significant genes at the 0.05 level as a plain text file:

```
sig_genes <- res[res$padj <= 0.05 & !is.na(res$padj), "symbol"]
print(paste("Total number of significant genes:", length(sig_genes)))

[1] "Total number of significant genes: 8147"

write.table(sig_genes, file="significant genes.txt", row.names=FALSE, col.names=FALSE, quenes.txt", row.names=FALSE, col.names=FALSE, quenes.txt", row.names=FALSE, col.names=FALSE, quenes.txt"</pre>
```

This file is inputted into the website: "https://reactome.org/PathwayBrowser/#TOOL=AT". Parameters set to "Project to Humans", then analyzed.

Q: What pathway has the most significant "Entities p-value"? Do the most significant pathways listed match your previous KEGG results? What factors could cause differences between the two methods?

Cell Cycle, Mitotic has the most significant Entities p-value. This somewhat matches the KEGG results. For example, cell cycle is the most downregulated pathway shown in the KEGG analysis. However, many of the other significant up or downregulated pathways, such as DNA replication and Jak-STAT signaling do not appear in the top of reactome's list of significant p-values. Rather, some other pathways in gene expression and signaling are highlighted as significant, so the discrepancy might be due to the data being pulled from different sources that use different names to describe similar pathways.
